

The LED panel illuminates according to the selected setting on the variable browning control. The display acts as a toasting progress indicator, counting down how long is left in the toasting cycle. The toaster beeps when the cycle is complete.

An internal smart chip lowers bread into the toasting slots with a single touch and also regulates the toasting time. On the 'A Bit More™' setting, bread is automatically lowered for additional toasting time.

The 'Auto Lift and Look™' feature raises the bread carriage during toasting without canceling or resetting the cycle. This enables you to view, and if necessary, cancel the browning cycle. The dual independent toast controls allow each pair of slots to work independently and toast to different preferences.
