

OZONATOR INSTALLATION INSTRUCTIONS (if not factory installed)

Hello, and thank you for your purchase of an ozonator.

Because we are an OEM, the ozonator supplier doesn't supply us with any printed instructions, so please bear with our basic explanation...

For the ozonator install,

You'll need to find the ozone hose. It is usually wrapped around the air venturi hoses and has a plug in it (it is 1/4" i.d / 3/8" o.d.). If you look towards the top of the tub (from the inside equipment area), you should see the group(s) of air venturi hoses and the ozone hose (it's usually wrapped around them in some fashion) - it will have a plug in the end of it.

You should have received a one-way check valve with the ozonator also - it may be premounted onto the ozonator already.

You can mount the ozonator on the inside of the hot tub - we install it on the lip that we screw the black abs panel onto to. You can use a couple of screws, screw them into the lip and have the ozonator attached to them from the inside.

Cut off the plug that is in the ozone tube and insert it onto the end of the ozonator where the check valve is.

The ozonator plugs into the circuit board - there is a dedicated power socket for it on the upper right hand corner for you to plug it in.

Thank you again for your purchase.
