

Kaye Scoot-About and Optional Back Support

Model SB1, Back Support SBAO

SB1

Description and Use

The KAYE Scoot-About, a swivel wheeled scooter, is useful for both children and adults. The adjustable seat height makes it possible for children and adults to sit on the seat and propel themselves with their feet. This makes it possible to work on reciprocal movement, heel-strike and coordinated knee flexion and extension. These patterns, which are necessary for ambulation, can be practiced in sitting before standing balance has developed. We have found scooting on the KAYE Scoot-About to be a wonderful way to activate the hamstrings and quadriceps in a reciprocal pattern following dorsal rhizotomy or hamstring lengthenings. Since the seat is adjustable in height, the child can be positioned with the appropriate amount of hip and knee flexion for maximal movement excursions.

Features and Specifications – SB1

- Padded seat is 16½" x 12½".
- Adjustable seat height 8½" to 16½".
- Handgrips are 5" above seat.
- Four, 5" caster wheels move easily on firm surfaces.
- Overall width, 24".

Description and Use

The new, adjustable, removable back support for the Kaye Scoot-About, Model SBAO, provides support at the pelvis for children when seated on the Scoot-About. The back and side supports adjust in height and width to give optimal vertical alignment for the pelvis and trunk. Adding this accessory assures that the seat depth supports the entire thigh on the seat surface. The adjustable height of the posterior support maintains the pelvis in a vertical position and the lateral supports minimize asymmetry of the trunk. The SBAO is removable so that the Scoot-About can still be used by parents and therapists. Retro fits any Kaye Scoot-About.

Features and Specifications – SBAO

- Adjustable seat depth 5" x 12".
- Back dimensions 9" w x 5" h.
- Side cushions 4" x 4".
- Width between wide supports 5" to 11".
